

HSYCO

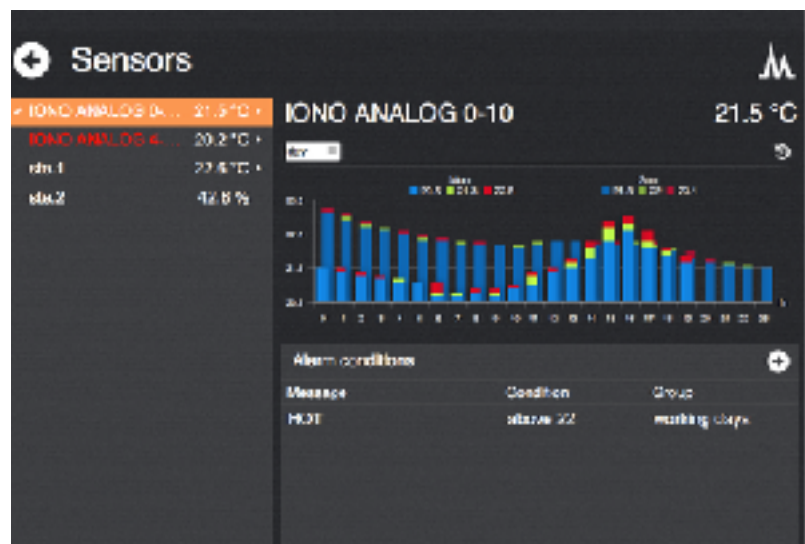

Alarms Manager

HSYCO Alarms Manager is a control interface that monitors field devices and a wide variety of sensors, generates alarms and notifications and is accessible locally or remotely.

The alarms can be sent via SMS or email or push notifications (Telegram) to groups of users.

The images from one or more IP surveillance cameras can also be displayed, and recording can be activated when an alarm is triggered.

HSYCO Alarms Manager can monitor any data point in over 80 standard and proprietary protocols for home & building automation, HVAC, security and safety, A/V and IoT. A complete list can be found in the I/O server section of the HSYCO wiki.

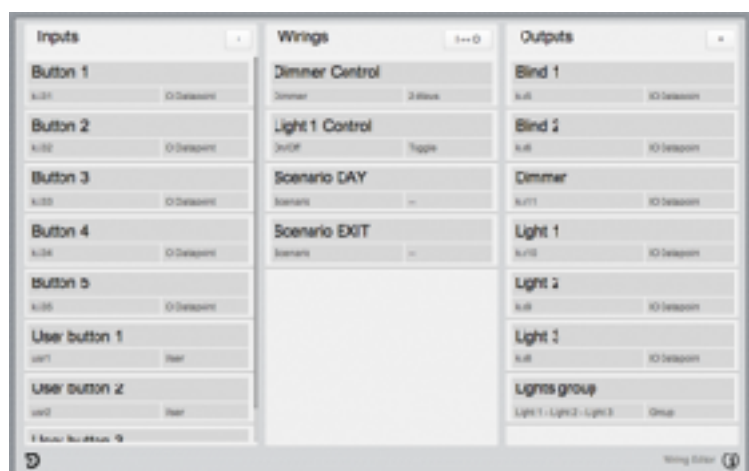

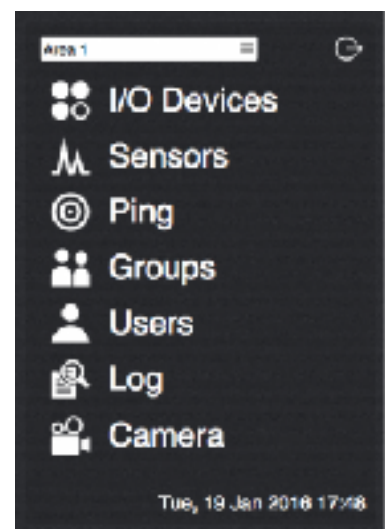

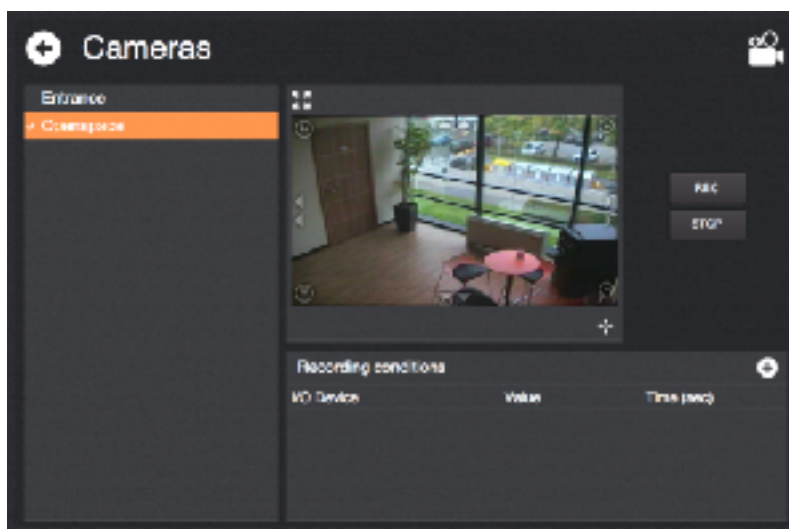

It is ideally combined with IONO Pi, an extremely versatile I/O module that includes several digital and analog input lines, power relay outputs and support for standard interfaces like 1-Wire and Wiegand.

With IONO PI Remote, data readings and alarms can be received via SMS messages

HSYCO Alarms Manager includes a guided configuration utility and a graphic interface for the creation of simple control logics for inputs and outputs.
